

A Appendix

Case	3	3.3	Total	% (3/Total)
A	258	3,266	3,524	7.3
B	332	1,648	1,980	16.8
C	282	1,362	1,644	17.2
D	100	1,012	1,112	9.0
Total	972	7,288	8,260	11.8

Table 9: Number of messages generated with each version of Llama used, broken down by case

Table 10: Advantages and Disadvantages of Each Scenario in Cyberbullying Detection

Scenario	Advantages	Disadvantages
<b>Baseline (Gold-Standard Only)</b>	High-quality, reliable data	High costs and scalability challenges; Requires significant time and expert annotation effort.
<b>LLM as Classifier</b>	No need for labeled data or training; Quick deployment; Handles nuanced language patterns.	Computationally expensive; May be less accurate than fine-tuned classifiers on domain-specific data.
<b>Synthetic Labels for Unlabeled Data</b>	Utilizes existing unlabeled data; Cost-effective dataset creation.	Label quality depends on LLM performance; May require validation to ensure consistency and accuracy.
<b>Fully Synthetic Data</b>	Enables training when no authentic data is available; Suitable for low-resource domains.	Synthetic data may lack diversity and realism; Risk of overfitting to generated patterns.
